## **Redding Introduces LR-1000 Precision Long Range Powder Measure**

Cortland, NY.....The popularity of big cases like the 338 Lapua Magnum and the 338 Remington UltraMag for long range precision shooting, have pushed standard powder measures to their limits. This highly competitive community has been forced to resort to double powder drops or working at the very outer limits of a measures capacity to throw the needed quantity of powder for these big cases. Neither practice represents the best solution, and with even larger cases like the Cheytacs, standard powder measures are simply left behind.

Redding has responded by using their 40 plus years of experience building Benchrest grade powder measures and developed a dedicated measure for the long rage precision shooter.

The Redding LR – 1000 measure has the features and quality Redding has long been respected for but with an all new metering chamber capable of producing accurate powder drops of up to 140 grs. with a single throw. The needs of the 338 Lapua are roughly 100 grs., and are easily accommodated within the middle third, or traditional sweet spot of this new powder measure.

The LR-1000 features Redding's cast iron construction with a hard chromed rotor and cutting edge as well as a zero backlash micrometer for accurate and repeatable loads over a lifetime of service. It also includes a larger powder reservoir and a powder baffle as standard. But the most important feature is the hemispherical cup at the base of the metering chamber which virtually eliminates bridging of long grain powders, assuring the most consistent charge weights possible, even at the highest settings.
