Body Die Instructions

Introduction

Body dies are designed to resize the body of your cartridge case and adjust the shoulder position (bump) for proper chamber fit without disturbing the neck diameter. Body dies have no internal parts and are intended to resize fired cases to proper dimensions (except for the neck) when they have become difficult to chamber from repeated firing and/or neck sizing.

Note: Body dies are **not** designed or intended to be used for resizing loaded ammunition.

Preparation

All Redding dies are protected in storage and shipment by a rust preventative which must be removed before use. Clean the inside of the die with a good grade of bore solvent and wipe thoroughly with a clean dry patch. Your body die will be used in a manner similar to that of a regular full-length sizing die which makes proper lubrication of the case is necessary. Visually inspect and clean your cases prior to lubrication. Use only a good grade of case lube such as Imperial Sizing Die Wax (Part #07600) and follow the directions on the package.

Adjustment

Body dies are designed with internal dimensions identical to full length resizing dies except for the neck diameter, which approximates your chamber size.

Under normal circumstances the body die is adjusted to make contact with the shellholder. If your chamber is known to be non-standard and/or has generous headspace, you should consider adding Redding Competition Shellholders to your bench. They offer precise headspace control and simple set up.

If you have any questions regarding the above procedures, please do not hesitate to contact our tech support members.
